

torch-spyre Weekly Health Report

Week of 2026-05-22 to 2026-05-28 | Generated 2026-05-28 | PyTorch 2.11.0+cpu

⚠ **Trend data is thin:** 4 daily reports for the current week, 2 for the prior week. Numbers are directional, not statistical. Consistent daily runs (e.g. weekday 9am cron) would tighten this.

Net positive week. Nightly CI recovered today after a 5-consecutive-day cat-zero-tensor regression. PR velocity up ~50% week-over-week. Bug count flat at the headline level, but the long tail (15 bugs aged >30 days, 9 of those >90 days) is the worry. Upstream churn is high in both deeptools (82 commits, 27% API-touching) and flex (9 commits, 67% API-touching) — watch the next nightly closely.

OLD

↓ **needs triage**

What Needs Attention

- 1 Stale bug backlog: 9 bugs >90 days old.** #488 (bool-tensor copy correctness), #637, #446, #456, #476, #537 etc. Reproducers may no longer apply on current main. Recommend a triage sweep this week to close-as-stale, re-validate, or re-label. Without it, the long tail will keep compounding.
- 2 Upstream API risk is High in both deeptools and flex.** Specifically: `flex a233ca5` adds `FlexAllocator::segment_for_region` (touches torch-spyre allocator integration), `flex 5132737` consolidates profiler macros (call sites using the split `PROFILER_STOP_HANDLE / PROFILER_STOP` will break), `deeptools 0ded6c7f` changes `BaseOpt/RcuOpt` header signatures. Schedule a torch-spyre rebuild against current upstream HEADs before next nightly.
- 3 6 Aging bugs (30–90d) need owner assignment.** #1392 (Granite vocab EAR overflow), #1712 (Llama mean), #1412, #1713, #1479, #1260 — recent enough to still matter, old enough to have lost momentum.
- 4 Confirm tomorrow's nightly stays green.** Today's PASS broke a 5-day cat-zero-tensor failure streak. Fix commit between May 27 and May 28 03:16 UTC isn't yet

identified — worth pinning down so the contributor gets credit and we know what changed.

5 **4 Fresh bugs from last 24h need first-touch triage:** #2329 (SDPA restickify), #2323 (torch.ne incorrect), #2314, #2313.

6 **FYI:** `LxPlanningTwoOpReductionTest` fp16-tolerance class produces sporadic flakes (`test_layernorm_2d`, `test_activation_fn_mish`). Widening atol or seeding inputs would close the rotating-flake noise. Not currently failing today.

Week-over-Week Trends

Metric	Current week (n=4)	Prior week (n=2)	Δ
Build pass days	4/4 (100%)	2/2 (100%)	→ stable
Nightly CI pass days	1/4 (25%)	0/2 (0%)	↑ recovered today
PRs merged (rolling 7d at end-of-week)	30+	20	↑ +50%
Open bugs (end of week)	54	30 ⁺	→ see footnote
New bugs filed (24h)	0 (May 26-28)	data not available	—
Bugs filed (last 7d)	4	data not available	—

⁺ **Bug count discrepancy noted:** The "30" in the prior-week dailies came from `gh issue list ... --json number | length` which silently caps at the default page size (~30). The accurate count today is 54 (with `--limit 200`). The "open bugs flat at 30" trend in earlier daily reports is therefore unreliable. Worth fixing in the daily-health-check skill so future trend data is accurate.

Today's Snapshot (2026-05-28)

Workflow	Status	Note
Spyre Hardware Tests	PASS	Healthy
Linters	PASS	Healthy
Upstream PyTorch Tests	PASS	Healthy
Nightly	PASS	Recovered after 2 consecutive failures (May 26-27)

Blocking PRs (cross-repo / API)

PR	Title	Status
#2218	Upgrade to PT 2.12	REVIEW_REQUIRED — fixes branch updated today via PR to ani300:2.12-upgrade
#2317	conv2d decomposition via matmul	REVIEW_REQUIRED
#2107	Fix layernormscale output scale for fp32 LayerNorm	REVIEW_REQUIRED (stalled 13d)
#2135	Add senprog handling	REVIEW_REQUIRED
#1943	Dualkineto integration	CHANGES_REQUESTED (stalled)

Active day with 16 PRs touched. New opens include #2360 (torch.exp enable), #2359 (multi-stick padding), #2358 (index_copy eager registration), #2355 (matmul coarse tiling), #2354 (CI inductor ops refactor). #2308 (ElementArrangement layout) and #2302 (lx mutation layouts) saw movement.

Persistent vs Flaky Failures

No persistent failures currently active. All previously-persistent nightly failures resolved on the 2026-05-28 nightly run.

Resolved during the week

test_cat_4d_dim2_zero + test_cat_4d_dim_m2_empty_first — 5 consecutive nightlies failing (May 22-27). Deterministic regression from PR #2089 (1D [0] scalar/zero-tensor layout change). PR #2259 (merged May 22) was an incomplete fix. Recovered on the May 28 nightly. Fix commit between May 27 and May 28 03:16 UTC — owner unidentified. Watch tomorrow.

test_instantiate_device_type_tests_mro — failed May 20-21 (PT 2.11 device-name regression). Fixed by PR #2161; green from May 22 onward.

Intermittent (watch)

test_layernorm_2d_lx_planning_reduction — failed 2/6 days (May 22, 26). Borderline fp16 precision in LX-planning reduction; observed delta 0.156 vs 0.1 allowed. Same flake class as the resolved `test_activation_fn_mish_fp16_lx_planning_reduction` (1 day failing only, May 20-21). Recommend widening atol or seeding the inputs in `LxPlanningTwoOpReductionTest`.

Bug Backlog (54 open total)

Bucket	Count	%	Top examples
Fresh (<24h)	4	7%	#2329, #2323, #2314, #2313
Active (≤7d, recently updated)	32	59%	#1423, #2177, #1969, #1919, #1883, #1837

Stalled-recent (7–30d, no update 14d)	3	6%	#2166, #1996, #1980
Aging (30–90d, no update 30d)	6	11%	#1392, #1712, #1412, #1713, #1479, #1260
Stale (>90d, no update 60d)	9	17%	#488, #637, #446, #456, #476, #537

The 59% Active share looks healthy but is partly inflated by automated cross-link updates on otherwise-old model-bringup bugs (Mistral-Small / Ministral families). Worth checking those updates reflect real progress, not just bot churn.

Cross-Repo Activity (Last 7 Days)

Repo	Commits	API-touching	Top contributors	Risk
deeptools	82	22 (27%)	Mannari (28), Venkataramani (23), Jain (10)	High
flex	9	6 (67%)	Du (3), Schneidenbach (2), Veerasingam (1)	High
torch-spyre	56	2 (4%)	Jana (14), marnold-ibm (4), Ganti (4)	—

Notable upstream commits worth tracking

Commit	Subject	Why it matters
flex a233ca5	Add region_id to segment_id mapping to FlexAllocator (#1034)	Public method addition on <code>FlexAllocator</code> ; consumed by <code>RuntimeStream</code> for segment-table dispatch. Likely surfaces in torch-spyre's allocator integration.
flex 5132737	[profiler] some API consolidation (#1018)	Re-combines <code>PROFILER_STOP_HANDLE</code> / <code>PROFILER_STOP</code> into one API and adds <code>PROFILER_HANDLE_ACTIVE</code> . Any torch-spyre call sites using the split macros will break.
flex c9e6f54	remove using directive (#1075)	<code>vf_streamer.hpp</code> drops namespace-level <code>using</code> ; downstream code relying on transitive symbol exposure may need explicit qualifications.
deeptools 0ded6c7f	[BaseOpt/RcuOpt] enabling 16HMI through virtual hbm segments	Modifies signatures across <code>baseOptimizer.h</code> and <code>rcuOptimizer.h</code> (4 headers, 19 insertions). Direct impact on any torch-spyre code linking against those optimizers.
deeptools f182ab3	add JobPlan launch (#2013)	Mirrored in torch-spyre; coordinated change already landed downstream.
